

a The formulation chemistry the workflow acts on

b Hard-segment association

What the hold measures

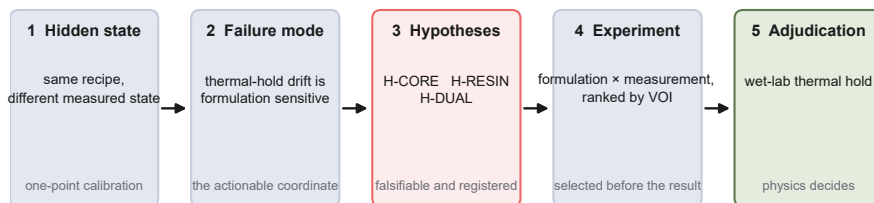

Holding at 120 °C lets this association keep building, so viscosity drifts while composition does not change. Drift is therefore a coordinate of its own, not a second reading of temperature response.

E1 +9.51% E5 +51.54%

15 → 60 min at 120 °C, same window

c One closed loop, from rheological state to physical adjudication

the measured outcome updates the hypothesis state

measured drift 1.60% proportional-dilution null 7.79%

H-CORE falsified under the frozen acceptance rule; H-RESIN retained
