

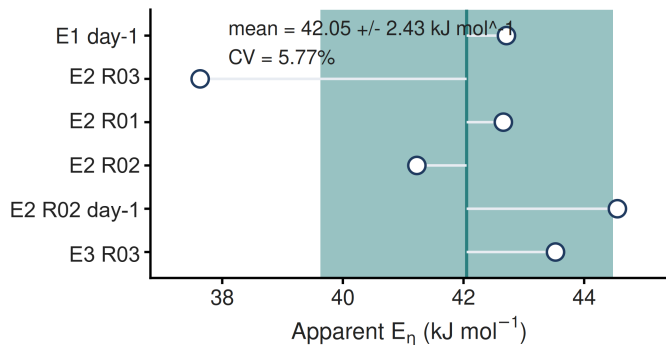

Figure 5 | Temperature response is locally concentrated while thermal-hold trajectory is formulation

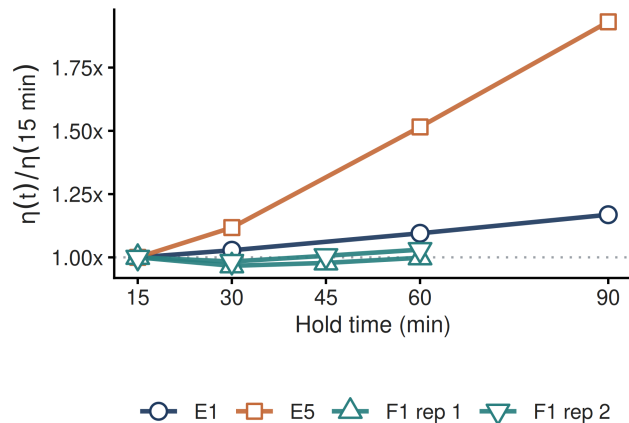

A Local temperature-response descriptor

Six chemistry-audited realizations; shaded band = mean $\pm$ 1 SD

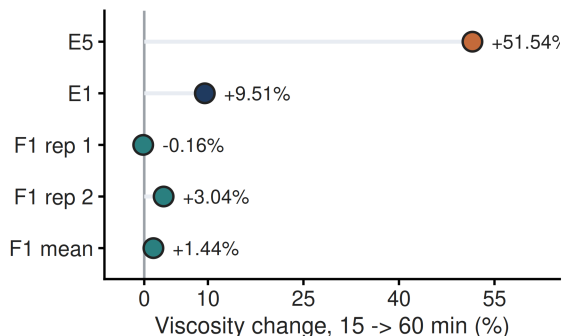

B Thermal-hold trajectories at 120 °C

Each trajectory is normalized to its own 15 min viscosity

C Matched-window temporal drift

Observed change between 15 and 60 min; F1 mean from two repeats

Temperature-response spread

CV(Eeta) = 5.77%

Thermal-hold contrast

$k_{E5} / k_{E1} = 4.29x$

D Rheological coordinates respond differently

Native descriptors are reported side-by-side; no common
